DETAILED ACTION

1. Claims 2, 4, 5-7, 20 are pending in the current application.

2. This application is a 371 of PCT/SE03/02004 filed 12/18/2003 which claims benefit of 60/435,130 filed 12/20/2002.

Request for Continued Examination

3. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on June 6, 2008 has been entered.

Response to Arguments

4. Applicant's arguments filed June 6, 2008 have been fully considered but they are not persuasive. The rejection under 35 U.S.C. 103 (a) for obviousness is maintained. The applicant has argued that Stevenson does not motivate one to choose the compounds with the amino group linker, since compound 49 with the CH_2 -NH- CH_2 group was less potent than the compound 12 with the CH_2 -O- CH_2 group (12.6 \pm 8.8 in the former IC_{50} vs. 0.95 \pm 0.41 IC_{50} in the latter). The examiner submits that based on the experimental error involved these two values are ostensibly the same. Regardless, what should be taken away from the teaching of Stevenson are two key conclusions: 1) The nature and substitution pattern of the aryl moiety has the most profound effect on the activity (See Table 1). 2) The activity of compounds like 48 and 49 is governed by the identity of the aryl ring. The large difference in activity between compound 48 and 49 is quite remarkable (compound 48 is essentially dead, while 49 is very potent). This is exactly the

place one would explore further SAR, in a place where big effects can be obtained. The fact that such changes gave these dramatic effects, is a strong motivation to continue to modify this position and as Stevenson suggests these aryl group modifications are most preferably groups with electron withdrawing substituents. The substituent applicant has modified the teaching of Stevenson with is the heavily optimized naphthyl group developed by Bernstein. This is not as the applicant's have suggested a hindsight reconstruction by the examiner, but rather a case of prima facie obviousness. If in fact Bernstein were working on a different receptor, a different biological target, this argument would be very persuasive, however the facts are that both Stevenson and Bernstein were working on very specific piperidine ligands for a single receptor, namely the NK1 receptor. One working in this field would have been immediately aware of the teaching of Bernstein and its relevance to the compounds of Stevenson. Stevenson experimented in a limited way with the aryl portion, but suggested that aryl groups bearing electron withdrawing groups would be preferred. Bernstein modified the phenyl portion by screening a diverse set of compounds where the phenyl was replaced with "over 100 aryl, heteroaryl and arylalkyl groups". In the words of Bernstein the result of this study was "the most potent, dual acting compound to come out of this array was the naphthamide 2a". The double patenting rejection is maintained as the applicant has failed to understand the grounds of rejection. This rejection was made for the difference between CH₂ and C=O. Obviousness type double patenting is a one way obviousness test and that is all that is required. It would be obvious to replace CH2 with C=O, to reduce the basicity, and the applicant is correct it would not be obvious to do the reverse, based on the teaching of Stevenson. However the one way test is all that needs to be met. Regardless the rejection is now in further view of Elliot et. al.

Page 3

Art Unit: 1625

Bioorganic & Medicinal Chemistry Letters 12 (2002) 1755-1758, which now allows the

rejection to meet the two way test.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness

rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the

invention was made to a person having ordinary skill in the art to which said subject matter pertains.

Patentability shall not be negatived by the manner in which the invention was made.

5. Claims 2, 4, 5-7, 20 are rejected under 35 U.S.C. 103(a) as being unpatentable over

Stevenson, Graeme I. et. al. "4,4-Disubstituted Piperidine High-Affinity NK1 Antagonists:

Structure-Activity Relationships and in Vivo Activity" Journal of Medicinal Chemistry, 1998,

41, 4623-4635, cited on the IDS, in view of Bernstein et. al. Bioorganic and Medicinal

Chemistry Letters 2001, 11, 2769-2773. The factual inquiries set forth in Graham v. John Deere

Co., 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for

determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

Determination of the scope and content of the prior art

(MPEP 2141.01)

Stevenson et. al. teaches compounds that are analogs of the compounds of the instant case

that have the same utility. In particular the compounds on page 4630 Table 4:

Art Unit: 1625

Table 4. Alternative Linkers

In order to buttress the examiner's conclusion and show that the examiner is not taking official notice, the examiner submits that Bernstein et. al. "Discovery of Novel, Orally Active Dual NK1/NK2 Antagonists" *Bioorganic and Medicinal Chemistry Letters* **2001** *11*, 2769-2773, clearly teaches the exact modification (down to the very precise substituents on the naphthyl ring), thus the use of naphthyl in these NK1-antagonists and the substitution of naphthyl for phenyl was very well known even in this very small field. Starting with the known selective antagonist SR48968, Bernstein modified the phenyl portion by screening a diverse set of compounds where the phenyl was replaced with "over 100 aryl, heteroaryl and arylalkyl groups". In the words of Bernstein the result of this study was "the most potent, dual acting compound to come out of this array was the naphthamide **2a**". Bernstein goes on to describe that "to follow-up the discovery of this naphthamide we explored the effect of substituents on the naphthalene ring."

It is interesting that 3-cyano-naphthyl was the preferred substituent, as in compound 4. This 3-cyano naphthyl group is also the preferred substituent of the instant case and is what

distinguishes these compounds from those of Stevenson et. al. There can be no doubt that this was the preferred substituent.

Ascertainment of the difference between the prior art and the claims

It is clear that the prior art differs only in the presence of a phenyl group for the naphthyl

of the instant case.

(MPEP 2141.02)

Stevenson et al. do not expressly teach the exact compounds of the instant case.

Finding of prima facie obviousness

Rational and Motivation

(MPEP 2142-2143)

It would have been obvious to one of ordinary skill in the art at the time the claimed

invention was made to use analogs of those of Stevenson et. al. to produce the instant invention.

Analogs differing only in the substitution of phenyl for naphthyl, are prima facie obvious, and

require no secondary teaching when the utility is the same. The experienced Ph.D. synthetic

organic chemist, who would make Applicants' compounds, would be motivated to prepare these

compounds on the expectation that such close analogues would have similar properties and upon

the routine nature of such experimentation in the art of medicinal chemistry. It would be routine

for the chemist to replace phenyl with naphthyl especially since the chemistry developed by

Stevenson was in place and the synthesis only involved using an appropriate naphthyl halide (see

scheme 5 of Stevenson et. al.), moreover Stevenson suggests that lipophilicity of the aryl moiety

to be important since compound **49** bearing the lipophilic CF₃ group has increased potency over compound **48** (see table 4 above), thus naphthyl being slightly more lipophilic would have increased potency. Naphthyl and more specifically, the 3-cyano naphthyl group is also the preferred substituent of Bernstein et. al. who showed the preference for naphthyl over phenyl.

Page 8

There can be no doubt that this was the preferred substituent.

Ex parte WESTFAHL, 136 USPQ 265 (Bd. Pat. App. & Int. 1962):

"Appellant relies upon the case of In re Jones, 32 CCPA 1020, 1945 C.D. 304, 579 O.G. 148, 149 F.2d 501, 65 USPQ 480, as supporting the patentability of claim 8 because in that case a naphthyl compound was held to be patentable over the corresponding phenyl compound. However, the rejection in that case was based upon the premise, held to be untenable by the court, that benzene and naphthalene are members of a homologous series. In the present case, the examiner does not rely upon any theory of homology but has cited a reference (Richter II) teaching that naphthalene is very similar to benzene and forms a series of analogous derivatives."

A reference is good not only for what it teaches by direct anticipation but also for what one of ordinary skill in the art might reasonably infer from the teachings. (*In re Opprecht* 12 USPQ 2d 1235, 1236 (Fed Cir. 1989); *In re Bode* 193 USPQ 12 (CCPA) 1976). In light of the forgoing discussion, the Examiner concludes that the subject matter defined by the instant claims would have been obvious within the meaning of 35 USC 103(a). From the teachings of the references, it is apparent that one of ordinary skill in the art would have had a reasonable expectation of success in producing the claimed invention. Therefore, the invention as a whole was *prima facie* obvious to one of ordinary skill in the art at the time the invention was made, as evidenced by the references, especially in the absence of evidence to the contrary.

One of ordinary skill is also one of "ordinary creativity, not an automaton". See Leapfrog Enterprises Inc. v. Fisher-Price. and Mattel Inc. UNITED STATES COURT OF APPEALS FOR THE FEDERAL CIRCUIT "An obviousness determination is not the result of a rigid formula disassociated from the consideration of the facts of a case. Indeed, the common sense of those skilled in the art demonstrates why some combinations would have been obvious where others

Art Unit: 1625

would not. See KSR Int'l Co. v. Teleflex Inc., 550 U.S., 2007 U.S. LEXIS 4745, 2007 WL 1237837, at 12 (2007) ("The combination of familiar elements according to known methods is likely to be obvious when it does no more than yield predictable results.").

Page 9

Double Patenting

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory obviousness-type double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent either is shown to be commonly owned with this application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement.

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

6. Claims 2, 4, 5-7, 20 are provisionally rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-10 of copending Application No. 10/525,303 in view of Stevenson et. al. "4,4-Disubstituted Piperidine High-Affinity NK1 Antagonists: Structure-Activity Relationships and in Vivo Activity" *Journal of Medicinal Chemistry*, **1998**, *41*, 4623-4635, cited on the IDS, in further view of Elliot et. al. Bioorganic & Medicinal Chemistry Letters 12 (2002) 1755–1758. This is a provisional obviousness-type double patenting rejection.

Art Unit: 1625

Copending Application No. 10/525,303 teaches compounds, compositions, and methods with compounds that are the amide analogs of the compounds of the instant case that have the same utility.

Ascertainment of the difference between the claims

It is clear that the copending application differs only in the presence of a carbonyl group for the methylene of the instant case. Stevenson et. al. teach that the basicity of the alkyl amino nitrogen is important for the activity:

"If the 3,5-bis(trifluoromethyl)benzyloxy side chain of 12 is replaced by the 2methoxybenzylamino group found in 1 and 2 to give 48, the resulting compound has poor affinity for the NK1 receptor (31% @ 1 iM). This is a significant departure from the observed SAR of the cis-(2S,3S)-piperidine-based series where the O- for N-substitution provided equipotent compounds (although it should be noted that 2-methoxybenzyl ether side chain in the quinuclidine type NK1 antagonist has poor NK1 affinity 26). The explanation for this may lie in the fact that in compounds such as 2 the benzylic amino group is directly attached to the piperidine/ quinuclidine ring (see above). In the case of 48 the benzylic nitrogen is not directly attached to the piperidine ring and is consequently more basic (48, pKa N-1 10.6, pKa N-2 8.2). If at physiological pH both the piperidine and side chain nitrogens protonate, the benzylic nitrogen will no longer be able to act as a hydrogen bond acceptor. A secondary factor may be that ortho substituents are not well-tolerated in this system (Table 1). To examine the effect of the pKa of the side chain nitrogen, the 3,5-bis(trifluoromethyl)benzylamino compound 49 was prepared. The inductive effect of the trifluoromethyl groups now decreases the electron density at the nitrogen (49, pKa N-1) 10.13, pKa N-2) 5.92), and it will therefore be less likely to protonate at physiological pH. This would indeed appear to be the case as 49 (IC50) 12.6 nM), although less active than 12 (IC50) 0.95 nM), did recover most of the lost affinity. Mutagenesis studies using 48 and 49 have also lent weight to this theory.24 In the case where Lys106 has been mutated to Glu106, 48 shows a large increase in NK1 affinity from >100 to 30 nM, indicating that the protonated form of 48 develops a more favorable interaction between ligand and receptor. The NK1 affinity of 49 is however decreased by this same mutation (from 8.0 to 47 nM)."

Art Unit: 1625

The interchangability of the linking moieties (amine vs. amide) is taught by Elliot et. al. in his

NK-1 antagonists.

"Table 1 summarises the effect of modifications to the amide linker of 2. Throughout, trans-isomers have higher affinity than the corresponding cis-isomers. A number of different linkers are tolerated, most notably the amides 2 and 15, the amine 17 and ether 23. The relatively poor affinity of the propyl linker 24 (hNK1 IC50 40nM) shows that a heteroatom in the chain is beneficial. This could be because the heteroatom introduces a conformational bias which favours binding, or due to participation of the heteroatom in a hydrogen bond to the receptor." Pg. 1756-1757 Bioorganic & Medicinal Chemistry Letters 12 (2002) 1755–1758

^{*}Displacement of [125]-labelled substance P from the cloned receptor expressed in CHO cells. Data are mean \pm SD (n=3).

They are all "tolerated" according to Elliot.

(MPEP 2141.02)

The copending application is not directed to the exact compounds of the instant case.

Finding of prima facie obviousness

Rational and Motivation

(MPEP 2142-2143)

It would have been obvious to one of ordinary that the amide analogs of the instant case would be active as suggested by Stevenson et. al.. and taught by Elliot et. al. The experienced Ph.D. synthetic organic chemist, who would make Applicants' compounds, would be motivated to prepare these compounds on the expectation that such close analogues would have similar properties and upon the routine nature of such experimentation in the art of medicinal chemistry. It would be routine for the chemist to make the amides especially since the chemistry developed by Stevenson was in place and the synthesis only involved using an appropriate naphthyl halide or acid (see scheme 5 of Stevenson et. al.), moreover Stevenson suggests that compounds with an amino nitrogen that is too basic are less active. It goes without saying that the amino nitrogen is substantially more basic than an amide. In fact an amide is somewhat acidic. Furthermore Elliot et. al. teaches that they are in fact interchangeable.

In light of the forgoing discussion, the Examiner concludes that the subject matter defined by the instant claims and those of the copending application is a clear case of double patenting.

Conclusion

7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to David K. O'Dell whose telephone number is (571)272-9071. The examiner can normally be reached on Mon-Fri 7:30 A.M.-5:00 P.M EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Janet Andres can be reached on (571)272-0867. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
